emergency.”

WHAT YOU NEED TO KNOW ABOUT YOUR TREATMENT

It is imperative that you follow these instructions as outlined below to have an effective treatment. Bedbugs require the most prep work by occupants than all other pests.

1. Strip Your Beds –Remove all sheets, blankets, mattress covers, pillowcases etc. from your beds and wash. Fold them and place them in plastic bags. Do not put them back on the bed until the evening after pest control service.

2. Remove everything from bedroom and hall closets. Your closets must be empty. Empty all dresser drawers and night stand drawers. Remove all clothing, toys, boxes, etc from bedroom floor.

3. Wash ALL clothing, towels and other linens. Place the clean items inside plastic storage bins or plastic garbage bags. Store them in the living room until after treatment.

4. Vacuum. Vacuum floors, furniture, inside closets, dresser drawers, and bed stands. Also vacuum mattresses and box springs. Dispose of vacuum bag.

5. Provide access for pest control technician. Make sure the technician can get into all closets. If possible, move bedroom furniture away from walls so there is a 3 foot space between the furniture and walls.

6. Avoid contact with insecticide until dry. Make sure there are no animals or people in the apartment during treatment and for at least 2 hours afterwards.

HOW DID BED BUGS GET INTO MY HOME

Bed bugs are moved into and around a dwelling through infested furniture and bedding. They can also enter a home or hotel by being carried in on clothing or luggage. Bed bugs are often carried into a home on objects such as furniture and clothing. Bed bugs can also travel from apartment to apartment along pipes, electrical wiring and other openings.

Bed bugs are often carried into a home on objects such as furniture and clothing.

When bed bug infestations are small, the bed bugs tend to reside near the bed. As infestations grow larger, they tend to move beyond beds into other locations such as sofas and upholstered chairs. Bed bug females may lay their eggs away from a heavy infestation to provide greater chance for survival. If the infestation is heavy, a sweet smell may be noticed in the room.

Although even the cleanest homes and hotels can have bed bugs, regular house cleaning, including vacuuming your mattress, can help to prevent an infestation. Clean up clutter to help reduce the number of places bed bugs can hide

WILL BED BUG BITES MAKE ME SICK?

While bed bugs are not known to transmit any pathogens or diseases, their bites usually result in swollen red, itchy welts.

Though bed bugs are not known to transmit disease, bed bugs can severely reduce quality of life by causing discomfort, sleeplessness, anxiety, and embarrassment.

Many people are not aware that they have been bitten, but some people may be more sensitive to the bite and may have a localized reaction. As a bed bug is biting, it injects anesthetic saliva to numb the pain. It also contains anti-coagulant to keep the blood of its meal host flowing.

People can be allergic to bed bug bites, which can cause swelling, itchy welts and in some cases infections. These infections can be serious, especially if they are from a resistant form of bacterial pathogen such as *Methicillin Resistant Staphylococcus aureus* (MRSA).
